

# OmniGold™ Compound Fertilizer

## Plus optional Ferticoat™

Many Australian soils are lacking in phosphorous (P) which is essential for early crop development. Crops use P as one of their main energy sources right through to seed and fruit development. Many traditional basal or planting fertilizers are based on European blends, which have much less P than is required in Australian soils.

**OmniGold™** offers much higher P with essential zinc and copper in a sulfate based compound.

**OmniGold™** can be coated with **Ferticoat™**, Omnia's advanced coating system, optimising nutrient availability. This system offers the added benefits of kelp and humates giving early root stimulation and minimising leaching through natural chelation.

OmniGold	Specification
Total Nitrogen	10.0 % wt. Min.
Total Phosphorus (P)	10.9 % wt. Min.
Total Potassium (K) - as sulphate of Potash	10.8 % wt. Min.
Sulphur	6 % wt. Min.
Copper	0.1 % wt. Min.
Zinc	0.2 % wt. Min.

Omnia's advanced coating system.
